

Project overview

Farr Wind Farm is located approximately 3.7km from the village of Farr and 5.6km from Tomatin to the east.

The wind farm has been operational since 2005 and currently consists of:

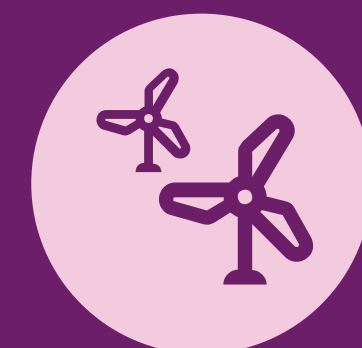

40 turbines
Maximum tip height of 102m

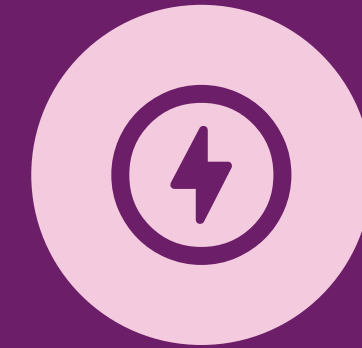

92 MW installed capacity

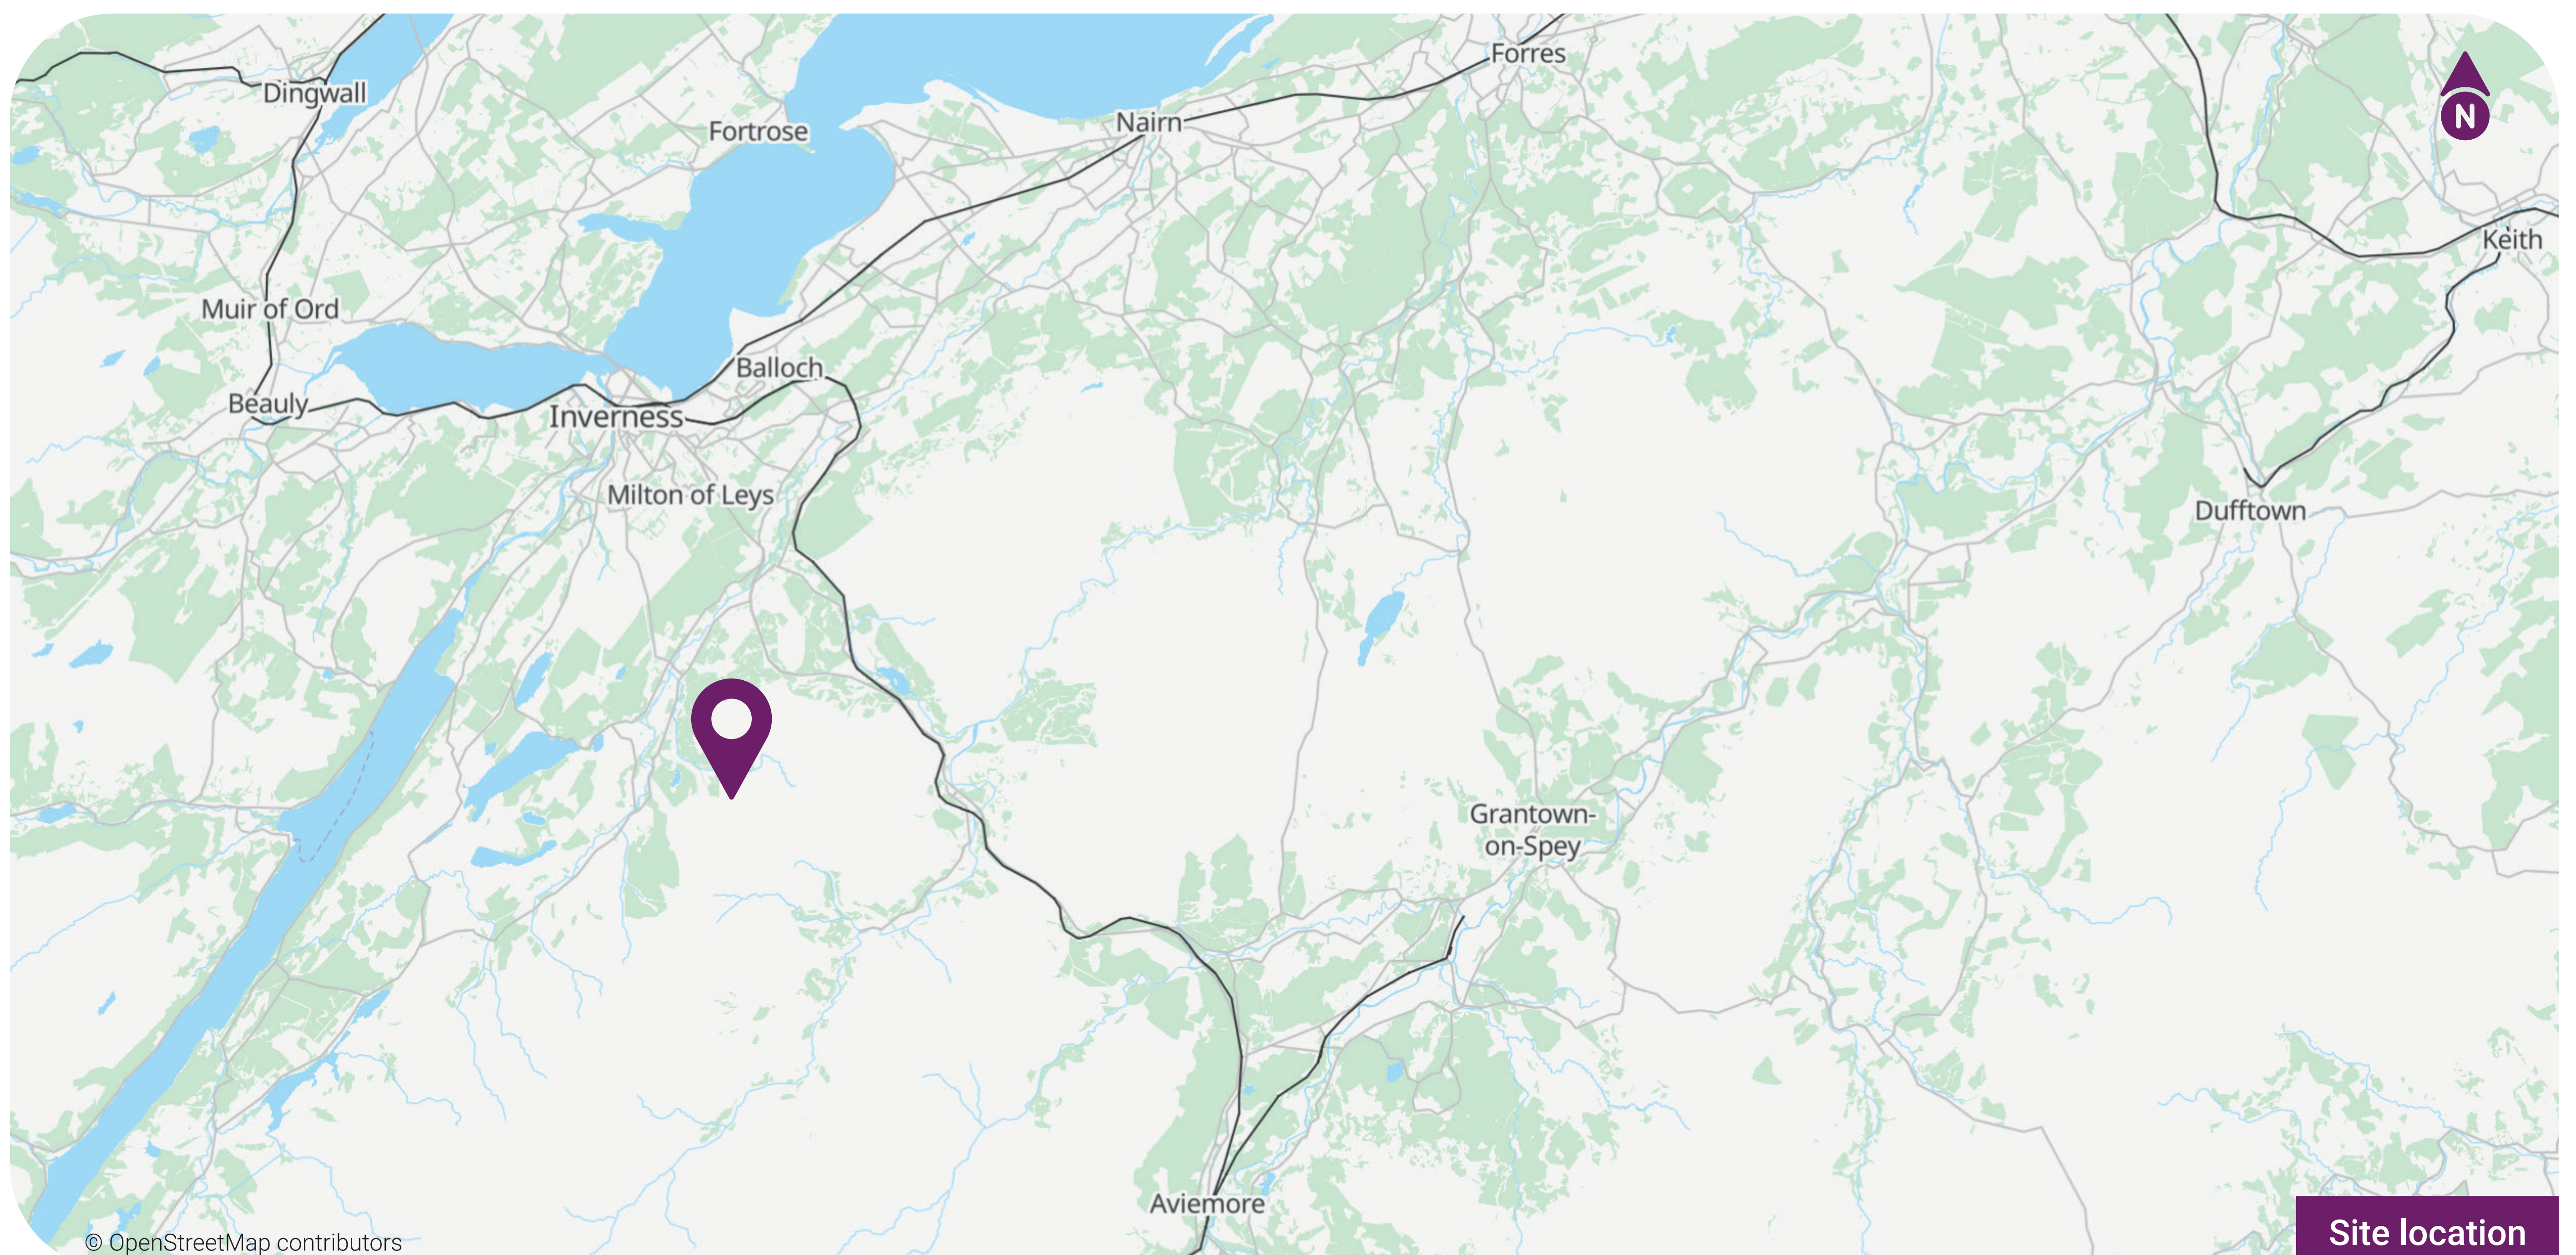

We are exploring the potential to maximise the capacity at the site by extending the project to the north. Our current proposals involves:

10 turbines
Maximum tip height of 200m

Up to 67MW installed capacity

By proposing further turbines at Farr Wind Farm, this will allow us to:

Utilise existing energy infrastructure

Increase generating capacity

Continue to make a positive social and economic contribution locally
